

# Netpet CMS Setup

## 1. Upload your Files

Upload the Netpet CMS Files into a Directory on your Webserver

## 2. Setup the Media Database (MDB)

Do a "CHMOD 777" on every folder from the "MDB" folder as well as on the .htaccess file in the root folder

## 3. Setup the MySQL-Database

Set up your MySQL-Database with the .sql file included in your downloaded Files

## 4. Setup your Configuration

Modify the "config.php" file in the "netpet" folder to your needs (Further information on every possible setting is provided in the "config.php" file itself)

## 5. Setup up Search-Engine friendly links

If you have chosen **not to activate the "mod\_rewrite"** option in step 4, please move on to **step 6!**

If you have chosen to activate the "mod\_rewrite" option please

- a. Surf to <http://www.yourdomain.com/yourfolder/netpet>
- b. Log in as "admin" "admin"
- c. Go to "System-Management" -> "Mod-Rewrite-Options"
- d. Press the "Update .htaccess" Button

## 6. Further Configuration

You have now successfully installed your Netpet CMS!

Now you can customize your system with the Build in System-Manager.

### a. Software-Manager

In “System-Management” -> “Software-Manager” you can activate and deactivate the built in templates, plug-ins, languages, tabs and color-styles as well as add new ones.

Note that it also possible to set the position of the installed components.

### b. Options

In “System-Management” -> “Options” you can edit pre-set options from your System like “max\_login\_fails” and the corresponding “exceed\_time” (in minutes) if a user has failed to log in to many times.

For programmers it is also possible to add new options which can be read with the “getOption” function from every Netpet component.

**Tip:** If more than only one person is working with your Netpet, it is recommended to give them no “Superadmin” rights when you are creating their account, because the “System-Management” is only visible for Superadmins to prevent false handling of that vital tool.

**Have fun!**
